# Coding of Permutations

---

Every permutation  $A = (a_1, \dots, a_n)$  of number  $1, \dots, n$  can be encoded by a sequence  $B = (b_1, \dots, b_n)$  in which  $b_i$  equals the number of all  $a_j$  such that  $j < i$  and  $a_j > a_i$ , for  $i = 1, \dots, n$ ,

# Example

---

The sequence  $B = (0, 0, 1, 0, 2, 0, 4)$  is the code of the permutation  $A = (1, 5, 2, 6, 4, 7, 3)$ .

# Task

---

Write a program that

-> reads from the input the length  $n$  and the successive elements of the sequence  $B$ .

-> examines whether the sequence is a code of some permutation of the numbers  $1, \dots, n$ .

-> if so, finds that permutation and writes it to the output, or otherwise writes to the output one word: NIE (Polish for no).

# Examples

---

Input:

7

0 0 1 0 2 0 4

Output:

1 5 2 6 4 7 3

# Examples

---

Input:

4

0 2 0 0

Output:

NIE
